

Curriculum Vitae

Ameer Bazzar

[<Bazzarameer3@gmail.com>](mailto:Bazzarameer3@gmail.com)

Education

Bachelor of Engineering, Birzeit University

- Technical Team – Google Developer Student Club

Work Experience

Exalt Technologies

Sep, 2022 – Present

SRE Development Engineer - Nokia

Mar, 2025 – Present

As an SRE Development Engineer at Nokia, I focus on ensuring the reliability, scalability, and efficiency of cloud-native systems. My role combines software engineering and operations to build automation, optimize infrastructure, and maintain high system availability.

- Designed and implemented automation tools to improve reliability and reduce manual operational work.
- Enhanced CI/CD pipelines to accelerate deployments and ensure consistent delivery across environments.
- Monitored system health and performance using Prometheus, Grafana, and ELK stack, setting up proactive alerting.
- Worked on Kubernetes clusters to optimize container orchestration, scaling, and resilience.
- Collaborated with cross-functional teams to troubleshoot complex issues, improve system uptime, and enhance overall reliability.
- Contributed to developing internal frameworks and tooling to support high-availability services.

Backend Engineer - Nutanix

Oct, 2023 – Mar, 2025

Nutanix is a cloud computing company providing hyper-converged infrastructure (HCI) solutions to simplify IT and manage hybrid multi-cloud environments.

- Gained expertise in Disaster Recovery (DR) technologies, including Nutanix-specific solutions, ensuring 0 RPO and seamless failover for critical workloads.
- Experienced in protection Nutanix Prism Central-based DR solutions for guest VMs, volume groups.
- Skilled in defining Recover Point Objectives (RPO) and Recover Time Objectives (RTO) to

align with business continuity goals and ensuring near-zero data loss.

- Experienced in configuring and managing various failover types, including planned, unplanned, and cross-cluster live migration of VMs, ensuring flexibility and rapid recovery in all disaster scenarios.
- Automated disaster recovery workflows using the Nutanix Nutest testing framework, ensuring efficient and reliable DR operations.
- Developed comprehensive test plans to validate DR workflows.

Technologies: Python, C++, Nutest, Docker, K8S, AWS, PostgreSQL

Backend Engineer - Nokia

Sep, 2022 – Oct, 2023

Nokia Convergent Charging (NCC) is a cloud native charging solution that provides real-time rating and charging capabilities, enabling new monetization opportunities for communication service providers (CSPs) and enterprises.

- Designed and implemented backend solutions for feature-specific challenges in NCC system to encompass voice, data, and SMS charging solutions.
- Developed a feature for managing bonus buckets within a separate microservice, leveraging customer charging and recharging times.
- Monitored system performance using Prometheus, tracking key metrics such as CPU utilization, memory consumption, latency, and overall system responsiveness.
- Established effective communication channels between the microservice and the main project using local Maven.
- Conducted rigorous performance testing using Apache JMeter to optimize system responsiveness.
- Developed a feature for refactoring and updated a python code responsible for generating and displaying Call Detail Record CDR information.
- Developed a feature to handle different HTTP status codes that allows customers to configure specific status code and string combinations for session termination.
- Optimized data storage and retrieval techniques using Aerospike.
- Executed API testing using Robot Framework to validate software functionality.
- Actively participated in code reviews and contributed to maintaining high code quality standards.
- Skillfully managed projects and tasks using Jira, ensuring efficient workflow management, task tracking, and effective collaboration within cross-functional teams.

Technologies: Java, SpringBoot, Python, Aerospike, Gerrit, Jira, Robot, Kafka, Linux, Prometheus

Projects

Graduation Project (Smart E-Nose System for Early Lung Cancer Diagnostics): Developed a device that utilizes Machine Learning to detect lung cancer through breath analysis. The system demonstrated significant potential in early-stage diagnosis, showing improved accuracy compared to previous research in the field.

Speech Encoder Decoder: Implemented a full Speech Encoder Decoder using PyAudio, SciPy, Numpy, and filtering techniques such as Butterworth filters.

University Database: Developed a desktop application that stores and updates teacher, student, accountant, and administrator information in a relational database using Java and SQL.

Projects Distribution Gen-AI: Orchestrated project distribution using Genetic AI in Java and Python, integrated a user-friendly Java-based UI, and harnessed Genetic AI techniques for precise allocation based on student preferences.

Virtual-Memory-Management-Simulation: Designed Memory Management Unit (MMU) simulations in Java (LRUMMU, FIFOMMU, CLOCKMMU, SecondChanceFIFOMMU) to optimize memory operations and synchronized process management using a Scheduler.

Coding Competitions

IEEEExtreme – IEEE Birzeit – 2021

Hashcode – Google – 2020, 2021, 2022

Kickstart – Google – 2021

Birzeit University – 2020, 2022

Programming Languages

Python, Java, C, C++, Flutter

Frameworks

SpringBoot, Robot

Databases

SQLite, MySQL, MongoDB, Aerospike

Other Technologies and Tools

Jira, Gitlab, GitHub, Gerrit, PyCharm, VSCode, IntelliJ IDEA, Docker, AI/ML, Flutter

Languages

Arabic: Native speaker

English: Fluent
