

DORAK

A mobile app for group savings circles — Flutter on the phone, Django REST API, and production hosting. Built and maintained by Ameer Bazzar. Available in English and Arabic. Built for the Qatar market.

48 Flutter screens	1,700+ English and Arabic texts	Full cycle Groups · pay · admin
------------------------------	---	---

The problem

Savings circles still run on chats, spreadsheets, and informal trust. Members miss payments, receipts get lost, and admins have no shared record of who paid and who is next to receive money. DORAK moves that process into an app: join a group, pay, review payments, go to the next round, and notify everyone — in Arabic and English.

What I built

Member app Onboarding, email/phone login, fingerprint/face unlock, dashboard, group browse and preview, join requests, invitations and QR join, payment-photo upload, notifications, profile, and two-factor login.	Admin operations Check ID documents, create and start groups, approve members, invite many people at once, review payments, set who gets paid, export group reports as PDF.
Money layer One money system for joining fees and monthly payments. Amounts are calculated on the server. Admins review payment photos. Every change is logged.	Reliability Automatic reminders in the 7 days before a due date, phone push notifications, live updates, Redis cache, cloud storage for receipts and ID photos.

Architecture

Client Flutter 3, Firebase, secure storage, fingerprint/face unlock, Arabic layout	API Django REST, PostgreSQL, Redis, Celery + Beat, Channels	Cloud Railway / Render, Docker, Firebase, Cloudinary, HTTPS
--	---	---

Security in the product

- Two-factor login (email/SMS). One-time codes stored hashed. Extra checks before changing email, phone, or password.
- Login sessions expire after 30 days; logout and password change sign you out everywhere.
- Limits on how often someone can try to log in or register from the same IP.
- Money rules on the server: a user cannot approve their own payment or create a payout.
- Database row-level security on payments, notifications, ID checks, and group membership.

- On the phone: block screenshots on code/password screens; extra checks if the device is rooted or jailbroken.

My role

Flutter app, Django APIs, groups and payments, admin tools, notifications, security, and hosting. Real product software — not a tutorial copy. Payments use a photo of the receipt plus admin approval (no bank app inside DORAK), which matches how many savings groups work in this market.
